SynERP — Enterprise Resource Planning

ERP Platform • SaaS • B2B

Multi-tenant cloud ERP for SMBs. Inventory, orders, accounting, and omnichannel sales — all unified to digitize daily operations.

WHO IT IS FOR

SMBs still running inventory in spreadsheets

Stock figures live across several files, which one is current is decided by the filename, and month-end consolidation eats days of somebody's time. The hard part of moving off that is rarely the software — it is unifying columns that were each written differently.

Channel businesses selling through several routes at once

E-commerce, retail and wholesale each keep their own books, so the same item carries three different numbers. The system holds one authoritative stock and ledger, then pushes the figures back out to each channel and report.

Buyers under constant assortment pressure

Purchasing decisions get made on impressions and whatever sales says, so the slow movers sit in the warehouse while the fast ones run out. The product-selection module turns that into numbers you can argue about, drawn from actual sales and stock.

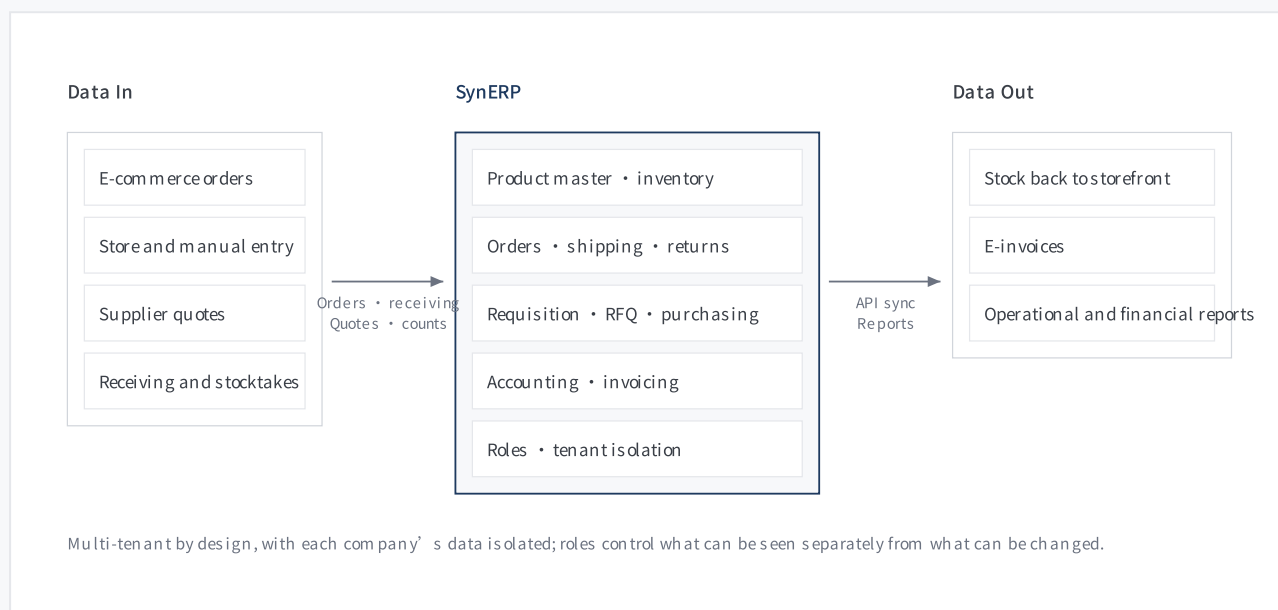

Companies whose existing system only does the books

The incumbent system handles accounting and tax filing while shipping, stock and purchasing stay manual. Modules roll out in stages: start with products and inventory and leave the accounting side as it is, rather than replacing everything at once.

Manufacturing that needs work orders, BOMs and production scheduling sits outside what these modules were designed for — they are built for trading and channel businesses. We assess that kind of requirement up front and say plainly if it does not fit.

SYSTEM ARCHITECTURE

Orders, receiving and quotes flow in from wherever they happen; the system keeps one authoritative stock and ledger, then pushes numbers back out to the storefront, the tax platform and the reports people actually read.

Orders: live counts for all, pending and in-progress plus the running total sit across the top, with status tabs filtering the list below. Each row carries the customer code, current status, amount and creation date. Note: the customer names and amounts are demo data as well.

CORE FEATURES

Inventory

Multi-warehouse, batch/serial tracking, safety stock, automatic replenishment.

Orders

Sales / purchase / returns flows with multi-payment and shipping integrations.

Accounting

Taiwan accounting standards: e-invoice, input/output VAT, P&L, tax filing summaries.

Omnichannel

Sync e-commerce platforms, POS, and physical stores into a single consolidated view.

Multi-tenant

Cloud multi-tenant architecture; per-seat and per-module pricing.

Open API

External system integration via REST API — avoid double data entry.

MODULES

Modules can be rolled out in stages rather than all at once. Most customers start with products and inventory, then extend into purchasing or accounting as the pain dictates.

Products and inventory

WHAT IT COVERS

Product master, categories and tags, multi-warehouse stock, stocktakes, assemblies

NOTES

Inventory is the spine of the system; the other modules hang off it.

Orders and shipping

WHAT IT COVERS

Sales orders, picking, dispatch, credit notes, returns

NOTES

Takes e-commerce orders as well as manual entry.

Purchasing and RFQ

WHAT IT COVERS

Requisitions, RFQs, purchase orders, receiving batches, competitor price comparison

NOTES

The RFQ module launched in August 2026, bringing quote requests and responses into the system.

Accounting and invoicing

WHAT IT COVERS

Receivables and payables, output and input tax, e-invoices

NOTES

Designed around Taiwanese accounting and tax practice.

Product selection

WHAT IT COVERS

Uses sales and stock data to support what-to-buy and how-much decisions

NOTES

Aimed at channel businesses under constant assortment pressure.

HOW IT GETS IMPLEMENTED

01 Map the current process

Understand how receiving, shipping and reconciliation actually run today — including the rules that live in spreadsheets or in one person's head.

02 Import the master data

Import products, customers, suppliers and opening stock, resolving data inconsistencies in one pass.

If opening stock is wrong, every report afterwards is wrong.

03 **Configure flow and permissions**

Set up warehouses, document flows, and what each role can see and change.

04 **Run in parallel**

Run the old and new ways side by side for a while, compare stock and accounting figures, and only switch once they agree.

05 **Cut over and operate**

The system becomes the source of truth; Shengyi handles updates and incidents from there.

FAQ

Do we need OMGO to use it?

No. SynERP can be deployed on its own purely for inventory and accounting. If you also run OMGO, stock and orders are connected directly so the store and the website share one pool. With other platforms it depends on the interface they expose.

We track stock in Excel — can that be migrated?

Yes, it imports. The real work is unifying the different ways the same item is written across spreadsheets, and verifying the actual opening stock — get that wrong and every later report is wrong.

How are permissions handled with multiple users?

Visibility and document actions are set per role. The system is multi-tenant, so different companies' data stays isolated from each other.

How long does implementation take?

It depends on catalogue size and process complexity. Straight inventory work moves fastest; cases involving accounting, invoicing or integration with an existing system need a longer parallel-run period. We give a real timeline after the initial survey.
